

Thinking about tomorrow, today.

Net metering and solar energy.

In 2013, the Public Service Commission approved net metering for solar users in Mississippi. Most homes equipped with solar panels do not have a means to store surplus energy. Once customers sign up for the net metering program, Entergy Mississippi will install a two-way meter to track any excess solar energy sent to the power grid. We can then credit these customers for their excess solar power, which helps offset their electricity costs.

The Public Service Commission has concluded that solar power is good for Mississippi, and we're proud to be leading the way.

This means that Entergy Mississippi customers can:

- Have **greater choice** when it comes to the electricity they use.
- Receive a **credit on their monthly bill** for excess energy sent to the grid.
- **Offset the cost** of their monthly bill by producing their own energy.

Excess Solar = Lower Bills
